

eCodes

We created our proprietary eCode Management System (EMS) as a cost effective way to house and deliver eCodes. Just as we house inactive physical cards in our secure warehouse, the EMS is a digital warehouse in that it is able to securely house inactive raw codes and live codes!

The EMS allows us to easily manage your eCodes and deploy them to customers without any fees to you or the customer. We are able to activate codes via your backend processor, just as we do with plastic. Once your codes are activated, they are loaded into the EMS and paired with a pre-approved template. The template is then uploaded to our web server as a secure encrypted URL and finally delivered to the customer.

Once the recipient clicks on the URL, your approved template will display the code assigned to them. From there the recipient can easily use the eCode at your local store or online.

With our EMS, eCodes are made easy. No setup costs or fees. And with our API, our customers can get your eCodes in real time.*

**Based upon activation processes.*
